

# PARROT

Portable Audio Recorder and Transmitter

## New concept in ENG recording

This handheld unit for the roving reporter not only records, but is also a communication device. The PARROT can be used for live reporting. Recorded quotes or interviews on the other hand can be sent in top quality to a server in the studio. And all of this without using a PC and using only your mobile phone. It is truly unique!

**It is multi-functional:**

**It's a recorder**

**It's a wireless transmitter**

**It's for live broadcasting and for file transfer**

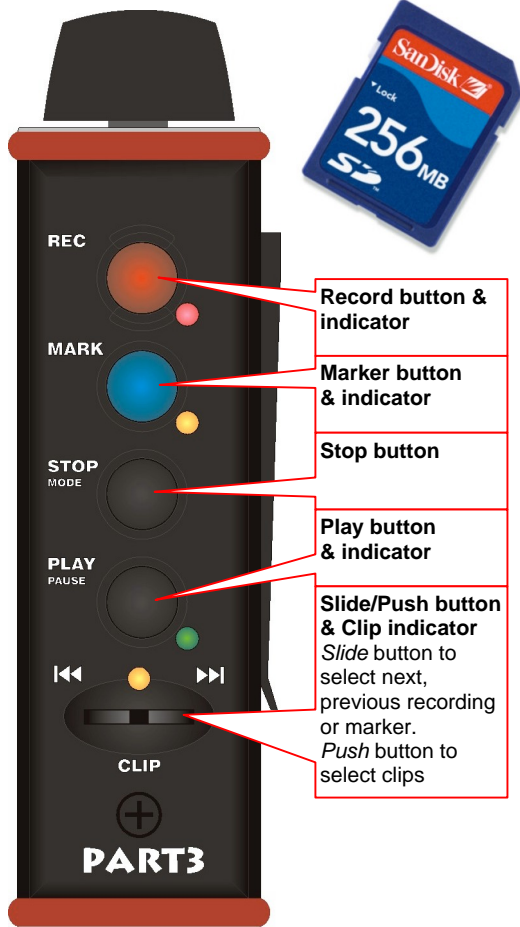

**It functions as an external sound card to your PC**

**It also presents itself as a flash memory when connected to your PC**

**YouCom**  
Audiocommunicatie BV

The PARROT is a high quality handheld audio recorder with professional connectors. The recordings are stored on a removable SD memory card in MP3 format. This gives over 4 hours of high quality recording on a 256MB-memory card. The unit is battery powered (4x type AA) and operates for 8 hours.

High quality recordings can be sent as a file to the studio without using a PC, but using a Bluetooth enabled device (PDA or mobile phone) over the GSM network, to any given location.

By connecting a Laptop or PC the recordings can be sent over the Internet (wifi) using GSM, GPRS or UMTS to any desired location.

The line output can also be used to send a recorded item over an ISDN, POTS or IP codec.

Live contributions to the studio can be made over the Bluetooth connection.

Markers can be set within an audio file. During recording and playback markers can be set or removed. The audio between two markers can be regarded as a clip, when in clip mode.

When connecting a USB cable to the PARROT, it will function as an external sound card of your PC or laptop. With this function the mic input can be used as an audio source, and the headset as an audio output device.
